

✓ 1. HTML, CSS, JS — The 3 Building Blocks of Web Development

🧱 HTML → Structure (The Building Blocks)

- Think of **HTML** as the **bricks** used to build a house.
 - It **creates the basic layout** of a webpage.
 - Examples:
 - `<h1>` = heading
 - `<p>` = paragraph
 - `<img>` = image
 - *Without HTML, a website has nothing — it's empty.*
-

🎨 CSS → Style (The Paint & Decoration)

- CSS is like **painting, decorating, and styling** your house.
 - Makes the website **beautiful, colorful, spaced properly**.
 - Examples:
 - `color: red;`
 - `font-size: 24px;`
 - `background-color: black;`
-

💡 JavaScript → Brain (Adds Life & Interactivity)

- JS is like adding **electricity and smartness** to the house.

- Makes the website **interactive**.
 - Examples:
 - Click button → popup
 - Form validation
 - Animations
-

✓ 2. DNS + ISP + Website Loading Explained Simply

🌐 What happens when you type google.com?

Think of DNS as the phonebook of the internet.

- You type **google.com**
- Your **ISP** (Internet Service Provider) gets the request
- ISP asks **DNS** server:
 - 👉 “What is the IP address of google.com?”
- DNS returns like a phonebook:
 - 👉 “Google = 172.217.168.238”
- Your browser now knows where Google lives and connects to it.

- ✓ Domain name = name of the person
 - ✓ IP address = phone number
-

✓ 3. A, AAAA, CNAME, TXT Records

Very simple:

- **A Record** → IPv4 address of the website (like 172.xxx.xxx.xxx)
 - **AAAA Record** → IPv6 address
 - **CNAME** → Nickname/alias of domain
 - **TXT** → Verification records (ownership, email security)
-

4. All HTML5 Tags

You **do NOT** need to memorize all the 100+ tags.

Instead, only **master these core ones** (from the "All You Need to Know" slide):

★ Most Important HTML Tags

- `<html>` → Root of the page
- `<head>` → Metadata (title, styles)
- `<body>` → Visible content
- `<h1>–<h6>` → Headings
- `<p>` → Paragraph
- `<a>` → Links
- `<img>` → Images
- `<div>` → Division/box
- `<span>` → Inline text container
- `<ul>`, `<ol>`, `<li>` → Lists
- `<input>` → Form input
- `<label>` → Label for input

- `<button>` → Button
- `<script>` → Adds JS
- `<style>` → Adds CSS
- `<section>` → Content section
- `<footer>`, `<header>` → Page layout structure
- `<iframe>` → Embedding websites

These 20 tags = 95% of real-world HTML work.

5. CSS Attribute Selector

Screenshot explains this:

Syntax:

```
p[draggable] {  
  color: red;  
}
```

What it means:

- Select all `<p>` elements
- That **contain the attribute** `draggable`
- And apply the style `color: red`

Example:

```
<p draggable="true">Drag me</p>
```

This `<p>` becomes red.

Real-life use cases:

- Styling input fields with `required`
- Styling links with `target="_blank"`
- Styling elements with `data-*` attributes
